Preface

This work was carried out at the Laboratory of Acoustics and Audio Signal Processing in the Helsinki University of Technology (HUT) (Espoo, Finland) during the years 1993–1995. I am deeply grateful to my supervisor, Prof. Matti Karjalainen, for constant help and friendship during all phases of my work and also for organizing financial support for my research.

I have had the possibility to conduct part of this study at CARTES (Espoo, Finland). I am grateful to Mr. Otto Romanowski (director of CARTES), Ms. Sini Sormunen, Mr. Harri Kaimio, Mr. Jan G. Liljestrand, Mr. Tuomo Rönkkö, Mr. Erkka Suominen, Mr. Juuso Voltti, and other people I have met in CARTES, for a pleasant and inspiring atmosphere.

I have also spent more and more time working at the Acoustics Laboratory in Otaniemi, and I want to thank the personnel of this slightly overcrowded laboratory for being friendly every day. Especially I want to thank our secretary, Ms. Lea Söderman, for her kind help in practical issues, and Mr. Jyri Huopaniemi and Mr. Martti Rahkila for their assistance in questions associated with computer networks and file formats. Jyri read the manuscript of this thesis and gave me several useful comments. I wish to thank Mr. Timo Kuisma with whom I had fruitful discussions on the nature of deinterpolation. We also worked together on two conference papers. Lic. Tech. Toomas Altosaar has proof-read many of my conference papers and has helped me to improve my English writing. I am deeply indebted to him for this. At the Acoustics Laboratory, I have had many interesting discussions with experienced scientists, such as Dr. Paavo Alku, Mr. Juha Backman, and Dr. Unto K. Laine, which I gratefully acknowledge here. Paavo read the manuscript and helped me with his insightful comments. My special thanks go to Mr. Tommi Huotilainen, with whom I share an office room at the Acoustics Lab, for being a tough opponent in the game of squash.

I wish to thank the pre-examiners of my thesis, Assoc. Prof. Olli Simula (Laboratory of Computer and Information Science, HUT) and Assoc. Prof. Julius O. Smith (CCRMA, Stanford University, California, USA) for their positive feedback and profound comments. I am especially happy that I have had the opportunity to discuss interesting issues related to physical modeling of musical instruments with Dr. Smith several times during the years 1991–1995 all over the world (e.g., in Finland, Sweden, Denmark, Japan, Italy, USA, Canada, and the Internet).

I would like to express my gratitude to Prof. Timo I. Laakso (SEMSE, University of Westminster, London, U.K.) who has played an important role in this study: with him I have written numerous papers that are related to this thesis. Furthermore, Timo gave me valuable comments on my manuscript thus helping me to improve my text.

I also want to thank Prof. Iiro Hartimo (Laboratory of Signal Processing and Computer Technology, HUT) who read an early version of my manuscript and gave me useful feedback. Mr. Luis Costa worked hard to find language deficiencies and typing mistakes in the manuscript. I want to thank him for his diligence. I learned a lot from his comments.

Dr. Jean–Marc Jot (IRCAM, Paris, France) and I had some inspiring e-mail discussions on time-varying digital filters. Mr. Stephan Tassart (IRCAM, Paris, France) has amused me with theoretically interesting questions related to Lagrange interpolation. I

have had some friendly debates with Mr. Maarten van Walstijn (Royal Conservatory, the Hague, the Netherlands) via e-mail, and also in Ferrara, Padua and Venice, about fractional delays and conical waveguides. I want to express my gratitude to these fine persons for their interest in my work.

I have had the possibility to write a journal paper with Prof. Tapio "Tassu" Takala (Laboratory of Information Processing Technology, HUT). I thank him for fluent co-operation and friendship. I wish to thank my coauthor Dr. Jonathan Mackenzie (SEMSE, University of Westminster, London, U.K.) for innovative co-operation. Mr. Rami Hänninen (Laboratory of Information Processing Technology, HUT) has recently started implementing a woodwind instrument model that employes fractional delay techniques presented in this work. Discussions with him have helped me to understand how to better describe some of the filter structures. My sincere thanks go also to Mr. Sami Linnainmaa (HUT) for his clever comments on the Thiran allpass filter. I am grateful to Mr. Martti Vainio and Mr. Olli Salmensaari for their help in getting hold of some interesting references that appeared to be difficult to find.

I thank my good friend, mathematician, poet, and rock musician, Timo Kojonen, for trying to weed out inaccurate mathematical notations in my work and especially for great company in the evenings. I would also like to thank my fiancée Miia Jaatinen for love and understanding also when I have been under pressure. Luckily enough, she is still not showing any particular interest in digital signal processing, and has always been successful in making me think of issues other than work or this thesis.

Finally, my warmest thanks go to my parents, Anneli and Pekka Välimäki, who have constantly encouraged me to study as much as possible, and given me the opportunity to do so.

The financial support of the Academy of Finland, the Finnish Cultural Foundation, and the Jenny and Antti Wihuri Foundation is acknowledged.

Westend, Espoo
November 30, 1995
